Igneous rocks such as granite or lava
are tough, frozen melts with little
texture or layering. Rocks like these
contain mostly black, white and/or gray
minerals. Sedimentary rocks such as
limestone or shale are hardened
sediment with sandy or clay-like layers
(strata). They are usually brown to gray
in color and may have fossils and
water or wind marks.

Everything You Need to Identify Rocks

Ideas and concepts in sedimentology are changing rapidly but fundamental field work and data collection remain the basis of the science. This book is intended as a guide to the recognition and description of sedimentary rocks in the field. It aims to help the geologist know what to observe and record and how best to interpret this data.

Geology - Wikipedia

Rock, in geology, naturally occurring and coherent aggregate of one or more minerals. Such aggregates constitute the basic unit of which the solid Earth is composed and typically form recognizable and mappable volumes. Rocks are commonly divided into three major classes according to the processes that resulted in their formation. These classes are (1) igneous rocks, which have solidified from ...

The concept of hysteresis is fundamental when describing and comparing the magnetic properties of rocks. Hysteresis is the variation of magnetization with applied field and illustrates the ability of a material to retain its magnetization, even after an applied field is removed. Figure 9 illustrates this phenomenon in the form of a plot of magnetization (J) versus applied field (H_{ext}).
