Promising new antiepileptic agents are on the horizon. For the most part, these are orphan drugs or repurposed older agents that were belatedly found to have previously unrecognized antiseizure effects. Some of these investigational antiepileptic drugs (AEDs) may even be disease-modifying agents. Forensics/Chain of Custody. Antiepileptic drugs (AEDs) used to treat seizure disorders are today among the most common medications for which clinical laboratories perform therapeutic drug monitoring (TDM) (1, 2). The first-generation of AEDs—carbamazepine, ethosuximide, phenobarbital, phenytoin, primidone, and valproic acid—were introduced by U.S. and European
