Changing groundwater levels are causing problems in many cities and urban areas throughout the world. Over-abstraction of water for prolonged periods has caused levels to fall with ensuing foundation settlement and structural damage caused by consolidation of the underlying strata, in addition to frequent deterioration of water quality. Conversely, the decline of industry in many cities and/or the provision of better piped supplies has led to greatly reduced water abstraction.

Urbanization has profound impacts on the hydrological cycle. These include radical, but not easily measured, changes in groundwater recharge, with modification to existing recharge mechanisms and the introduction of new ones. An analysis of factors controlling the infiltration process and potential groundwater recharge rates is given, and discussed through the results of five field surveys.

Microbiological contamination is a widespread problem in urban areas and particularly affects shallow groundwater points. Growth in water demand, especially for agriculture and hydropower. Groundwater quality can also be threatened by intense rainfall events, resulting in flooding, which is becoming more common because of climate change.

Rising groundwater levels have occurred in Riyadh despite the fact that it is situated in an arid area. A number of causes have been identified associated with high water usage, including losses from water main, leaking storage and septic tanks and irrigation. Poor natural drainage through the aquifer system prevents the high losses from draining deeper within the aquifer.

Urban areas have the potential to pollute water in many ways. Runoff from streets carries oil, rubber, heavy metals, and other contaminants from automobiles. Untreated or poorly treated sewage can be low in dissolved oxygen and high in pollutants such as fecal coliform bacteria, nitrates, phosphorus, chemicals, and other bacteria.

Groundwater is a highly useful and often abundant resource. However, over-use, over-abstraction or overdraft, can cause major problems to human users and to the environment. The most evident problem (as far as human groundwater use is concerned) is a lowering of the water table beyond the reach of existing wells.
