When the terrorist attacks struck New York City on September 11, 2001, boat operators and waterfront workers quickly realized that they had the skills, the equipment, and the opportunity to take definite, immediate action in responding to the most significant destructive event in the United States in decades. For many of them, they were “doing what needed to be done.” American Dunkirk shows how people, many of whom were volunteers, mobilized rescue efforts in various improvised and spontaneous ways on that fateful date. Disaster experts James Kendra and Tricia Wachtendorf examine the efforts through fieldwork and interviews with many of the participants to understand the evacuation and its larger implications for the entire practice of disaster management. The authors ultimately explore how people—as individuals, groups, and formal organizations—pull together to respond to and recover from startling, destructive events. American Dunkirk asks, What can these people and lessons teach us about not only surviving but thriving in the face of calamity?

The 1980s saw unprecedented changes to Alaska's hook-and-line fisheries and the commercial-fishing fleet--longlining halibut and black-cod, trolling king salmon. Halibut "seasons" compressed from near year-round scrunched to 24 hours--hours--and fishermen are still dead because of it. 100s of black-and-white photos add to the stories written at the time for the fish papers of the day, quoting many fishermen in real time and putting you right there on the docks and boats. New material establishes the scene and ties up the ends, all told a documentary history of a unique and fleeting era like none other before, since or ever again. Original hardcover coffee-table book reformatted from 9x12 to this hardcover 10x8 with no material lost. Apologies for no preview--some glitch will only show the entire book! Also available in softcover.

As research on the human, animal, plant and microbial genomes matures towards descriptive fullness, the need for understanding the proteome has clearly emerged as the next major endeavor of life sciences. Proteomics - the quantitative analysis of all proteins working in a cell at a specific time and at specific conditions - provides deep insight into the highly organized network of expression, modification and degradation of proteins. Compiled in this book are reviews and research articles which describe the recent advances and perspectives of this new field of research. The articles are grouped into the following sections: - Sample Preparation and Solubilization - Developments in Electrophoresis - Detection and Quantitation - Mass Spectrometry - Proteome Data Analysis and Management - Prokaryotes and Yeast - Biological Fluids - Eukaryotic Cells and Tissue - Oncology - Plants Proteomics is a new key for the functional analysis of living systems and of equal importance for basic as well as application oriented research.
